

Pur-fect Hydration: A revolutionized way to gamify hydration

Storm Chasers

Project Objective

Final Project:

The objective of this project was to create a fully functioning device that has a positive output to a group of people's daily lives. This project had to gamify a task in order to make someone's life easier. The idea that my group chose was to gamify the task of hydration and drinking water. The way we did this was by creating a game which tracks the amount of water a person has drank throughout the day based on their bodyweight and activity level which was entered in a keypad. The project had components like, pico, code, laser cutting, 3-D printing, and the ability to be visually appealing. The amount of water drank was determined based on a load cell. If the user drank enough water for a specific time period, then they would get points and a happy cat would appear. The goal was to keep the cat happy. However, if the user drank an insufficient amount of water or there was a lot of time between when the user drank water, the cat would turn sad and the buzzer would go off

Skills Used

Laser Cutting: Structure of the project.

3-D printing: Accessories required to display the gamification aspect.

2-D and 3-D modeling: AutoCAD (2-D) and Solidworks (3-D).

My Contributions

2-D modeling and Lasercutting:

Laser Cutting: Created the overall structure of the project by laser cutting wood to create the enclosure for the load cell and the pico.

3-D printing: Created a case for the OLED screen which displayed the pictures of the sad and happy cats.

2-D and 3-D modeling: Designed the parts for laser cutting in AutoCAD (2-D) and the parts for 3-D printing in Solidworks (3-D).

3-D printing:

3-D modeling
